

Propagation of signals from indoor small cells and optimization of cell positions

Hayley Wragg

Alan Tayler Day, 28th November 2016

Supervisors:

Prof C. J. Budd OBE, Dr. R. Watson,
Dr. K. Briggs, Dr. M. Fitch

University of Bath

Who are we?

PhD Student

Hayley Wragg

Previously studied an MMath at the University of Sussex now based at the University of Bath.

Supervisors

Primary Supervisor: C. Budd

Professor of Applied Mathematics at the University of Bath and Professor of Mathematics at the Royal Institution of Great Britain.

Secondary Supervisor: R. Watson

Senior Lecturer in the Dept of Electronic and Electrical Engineering at the University of Bath.

Industrial Supervisors

K. Briggs

A research mathematician, for BT TSO at Adastral Park.

M. Fitch

A research engineer for BT TSO at Adastral Park.

The Project

AIM

- Create an accurate model and reduce the time it takes to simulate indoor-to-indoor WiFi propagation in a domestic environment.
- Use the model to optimize the location several LTE-femtocells.

Proposed method

- Use intelligent algorithms and adaptive mesh techniques to decrease execution time.
- Compare simulation results to PDE models and to measured results from BT.
- Develop a stochastic model for the environment.
- Optimize the location of the transmitter using the developed model.

High volumes of data

More and more users are requiring high volumes of data. This causes a need for high frequency wave propagation. The high frequency causes a problem with indoor-indoor propagation.

High frequency

MULTI-PATH

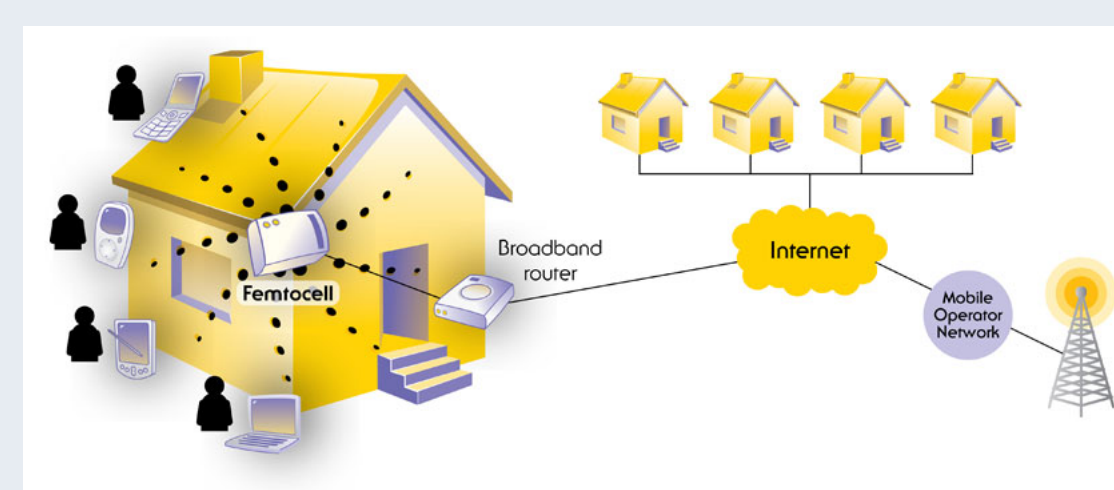

[1]

- Since the waves we are looking at are at a high frequency (typically of the order of 3GHz, but sometimes going higher) we can model them using ray-tracing.
- This is very computationally costly to run and requires lots of input information.

LTE-femtocell

LTE(Long Term Evolution) femtocells are low-powered base stations for the home designed to allow high speed data transfer [3, 8].

[2]

Domestic Environment

- A domestic environment is very cluttered, which reduces the number of Line of Sight Paths.
- Each collision results in the wave having a combination of reflections, diffractions, and refractions.

Collisions

When a wave collides with an object the collision causes a loss in signal power.

Reflection

[4]

Refraction

[5]

After colliding with an object at some angle of incidence i a ray is then reflected at an angle of reflection r .

When a ray travels through an object it is refracted slightly towards the normal.

Scattering

When colliding with a rough surface a ray can scatter. This can be unpredictable and can be computationally costly to simulate. [6]

Diffraction

Collision with the corner of an object this causes the ray to diffract which is also difficult to predict.

Where?

Adastral Park

Adastral Park is home to the research labs for BT.
